The Editor
BME Frontiers

Dear Editor,

Please consider the revised manuscript BMEF-D-26-00169, "Precision Synthesis of Multi-Tracer PET via VLM-Modulated Rectified Flow for MCI Stage Stratification." We thank the Editor and reviewers for their constructive comments.

The revision clarifies the clinical conditioning and extensive diagnostic-group-conditioned filling of missing scores, corrects the prepared clinical summaries, and adds clinical-only and MRI+Clinical classification controls. We distinguish the two-fold synthesis design from independent three-fold classifier evaluation and explicitly state source-identity and acquisition-record limitations.

We provide absolute synthesis metrics, additional frozen-prediction comparisons, masked image-quality evaluation, regional agreement and FDR/effect-size statistics, classifier uncertainty and paired comparisons, and objective supplemental cases with error maps. Results and interpretation retain metric-dependent and unfavorable comparisons. The method description now separates frozen encoders, affine-adapter analyses and actual generator conditioning, and reports the measured scope of one-step forward timing.

The title, abstract and conclusions have been restricted to cross-sectional classification and MCI stage discrimination. The available evidence does not establish longitudinal prognosis, clinical equivalence, independent incremental diagnostic value over diagnosis-related clinical inputs, or replacement of molecular biomarker confirmation. External validation is limited to historical AV45 synthesis in the OASIS-3 CN/AD cohort.

The accompanying response addresses all 56 reviewer comments individually and identifies corresponding manuscript and supplementary locations. We provide clean and highlighted manuscripts, supplementary materials and separate figure files for author review and submission.

Sincerely,

The authors of BMEF-D-26-00169
